
IntelliRisk

IntelliWorks' IntelliRisk solution utilizes state-of-the-art data integration, processing, and evaluation to empower financial institutions to proactively monitor, assess, and respond to critical risk triggers. This innovative approach helps Relationship Managers (RMs) and Risk Departments shift from reactive to proactive risk management, ensuring early detection of potential risks and more effective credit risk management.

Opportunity Statement

In the domain of corporate and commercial credit management, triggers are crucial indicators that signal changes in client creditworthiness. These triggers are defined using various internal and external factors and data points in the credit approval and monitoring processes. However, organizations are exploring whether these triggers can be more proactively managed and automatically tested and evaluated.

Risk and Relationship Managers (RMs) struggle to track and test these triggers consistently. The challenges amplify as portfolios scale, making consistent tracking and evaluation of these triggers increasingly difficult.

Example of challenges include:

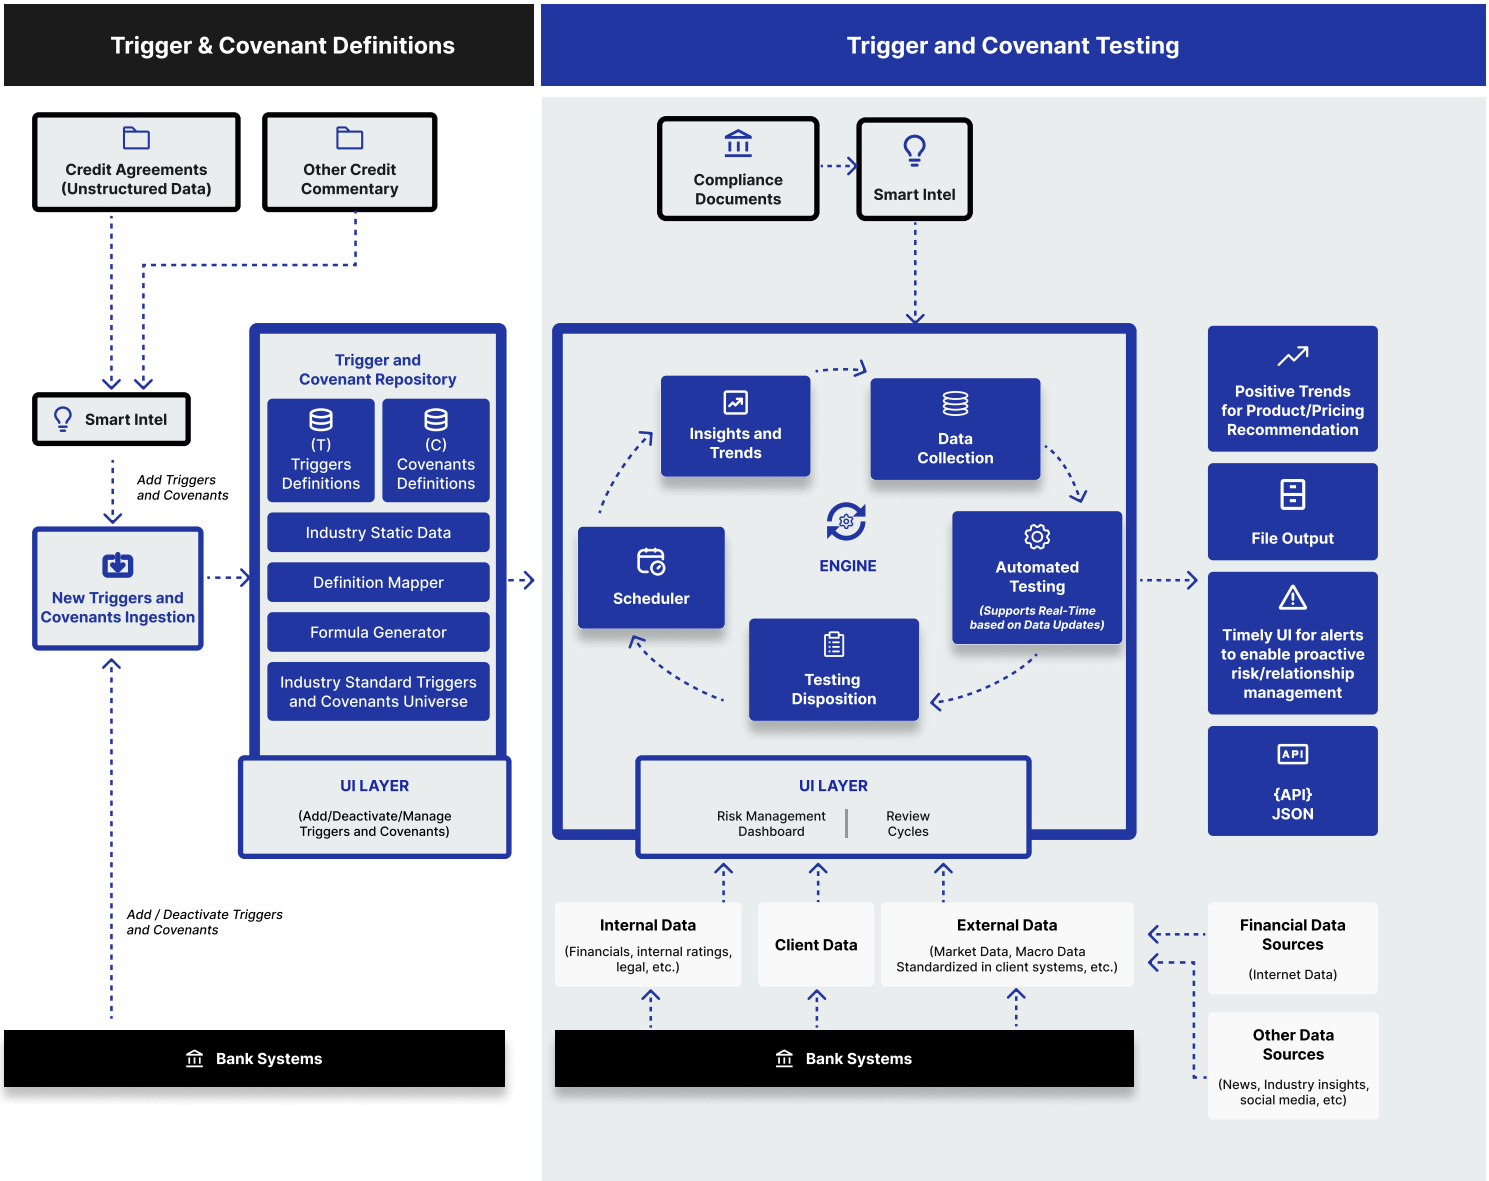
- A trigger scheduled for quarterly testing may miss intra-quarter evaluations and external data events requiring manual checks.

Engine Product Features

1. Tool to map and standardize trigger definitions with various internal and external client data points
2. Generate mathematical formulas for evaluations
3. Consume and integrate data from diverse internal and external sources to enable thorough tracking, testing, and actioning
4. Monitor testing results for signs/trends of deterioration
5. Enable early warning and timely alerts for proactive risk management

... and much more

How It Works



Trigger & Covenant Definitions
Trigger and Covenant Testing
Credit Agreements (Unstructured Data)
